Backend developer for smart home solutions

Do you have passion and competence for backend software development? And do you want to bring your deep understanding of IT into play to create leading IoT solutions? Then you could be the colleague we need to join our backend team.

Danalock is looking for a backend software developer to help us modernize our backend processes and software stack. The job comes with lots of freedom to choose the best technologies to get the job done.

Core responsibilities

- Implement state-of-the-art CI/CD pipelines across multiple teams.
- Assist in bringing our monolithic PHP backend application into a modern architecture exploiting microservices and serverless computing.
- Build efficient and optimal solutions by challenging ideas/opinions.
- Ensure product stability and robustness.

Joining us, you will be part of the backend team which is responsible for the development, infrastructure, and operations of our backend services. The team currently consists of two developers, a Scrum Master, and a Product Owner.

On a day-to-day basis, you will be responsible for your tasks and for planning your own time in coordination with the team. Most colleagues work at the Harlev J office, with one team member working remotely from Zealand. The team meets up daily at Scrum meetings to keep each other updated and aligned on tasks and impediments.

Your background

You have 3+ years of software engineering experience in one or multiple teams, building or maintaining a large backend system, with a strong background in Go or Python. Experience with most of the following technologies is also desired:

- Docker
- AWS
- MySQL or MariaDB
- CI/CD
- Git
- Linux

As a person

You are curious, passionate about your work, a team player and work well with challenges. You thrive with having responsibility of your own time and work.

Working at Danalock

We rely on the Scrum process model, so working knowledge of Scrum is an advantage.

As we are a small team, we get to be involved in different aspects of the products. This underpins our philosophy that everybody should think about the whole product - not just the part they are currently working on. We also encourage everyone to come up with product improvements or features in all areas of the Danalock ecosystem. This mentality is further emphasised by our non-hierarchical company structure. Beside the backend team, the development department also consists of teams focused on mobile apps and embedded software and hardware, which enables us to cover the entire area of the product development.

The company language is English, so you must be fluent in English both written and verbally.

What you get when working at Danalock

You will be working in an informal environment with a high degree of freedom in how you solve your tasks. That means, you will be responsible for determining what the appropriate tool is needed to solve tasks, without being afraid to try new methods.

When working at Danalock you get:

- A very flexible workplace
- Lunch arrangement
- Health insurance
- Pension

Is this you?

Do you think all this sounds like a position for you? Send us your resume and application and let us know why you should be our next colleague!

Applications or questions can be sent to Dina Hvidgaard, dh@danalock.com

Danalock

Danalock is a modern tech company that develops electronic lock systems, enabling people to turn their door into an electronic manageable portal. The company evolved over a decade from a basement start-up in 2010 to a worldwide provider today. All development is done in Denmark by skilled developers within electronics, software, backend, and apps. We thrive to find the best solutions for our customers by creating a flexible, encouraging, and innovating development environment.

Danalock is part of Salto Systems.
